Keywords: [In-car system, Traffic safety]

The pilot 'Wijzer op weg' (Road Wise) is a combination of two pilots ('In-car information' and 'Close contact') concerning in-car communication, with an emphasis on traffic safety. It involves driver assistance and other services. In 2004 a virtual reality simulation and a driving simulator will be developed. In 2005 a demonstration with a car-fleet is planned and research will be done on the impact of measures on the use of the road infrastructure.

The pilot 'Road Wise' is meant to give a glimpse of future possibilities for in-car systems, an intelligent car in an information society.

The pilot will tune in to two areas

- In-car information

An overview of the possibilities and consequences of different forms of communication will be given. It will concern traffic management and infotainment.

- Traffic safety

The influence of these communication methods on traffic safety will be analysed under different circumstances.

The goal of the pilot is to gain insight on in-car information in relation to traffic safety. In the future, it will provide a starting point for implementation of similar systems.
